The swirl of event-waves brings all the victims to the killer (or the killer to all the victims) and scatters everyone else away to relative safety, at least from that killer. One person might be pushed away from the killer by the energy of his event-wave front only to be destroyed in another tragic event.

The use of jet-swirl nozzle can improve engine performance and reduce complexity. Comparative analysis of different types of nozzles shows that swirl nozzles have strong advantages over other types of nozzles such as cross coaxial nozzle, shear coaxial nozzle, rotary nozzle and jet nozzle . Introducing a swirl component in the nozzle flow can enhance the propellant atomization and mixing and thus improve engine performance.

This work presents the study of the behavior of the internal flow in a swirl bipropellant injector, which is composed of an open-end (without nozzle) and a closed injector (with nozzle). In this way, each of these injectors has a characteristic behavior with respect to velocity distribution, pressure, and other main parameters.

The design of swirl atomizer is performed based on the requested atomizer characteristics which are sauter mean diameter (SMD), spray cone angle and break up length. Prediction and understanding of liquid film dynamics in the atomizer inside are the fundamental ways to explore atomizer performance.
